Fat (fȧt), *n.* **1** (*Physiol Chem.*) An oily liquid or greasy substance making up the main bulk of the adipose tissue of animals, and widely distributed in the seeds of plants. See *Adipose tissue,* under ADIPOSE

☞ *Animal fats* are composed mainly of three distinct fats, *tristearin, tripalmitin,* and *triolein,* mixed in varying proportions. As olein is liquid at ordinary temperatures, while the other two fats are solid, it follows that the consistency or hardness of fats depends upon the relative proportion of the three individual fats During the life of an animal, the fat is mainly in a liquid state in the fat cells, owing to the solubility of the two solid fats in the more liquid olein at the body temperature. Chemically, fats are composed of a fatty acid, as stearic, palmitic, oleic, etc., united with glyceryl. In butter fat, olein and palmitin predominate, mixed with another fat characteristic of butter, butyrin. In the vegetable kingdom many other fats or glycerides are to be found, as myristin from nutmegs, a glyceride of lauric acid in the fat of the bay tree, etc.

3 A heinous crime, especially, a crime punishable by death or imprisonment.

☞ Forfeiture for crime having been generally abolished in the United States, the term *felony,* in American law, has lost this point of distinction, and its meaning, where not fixed by statute, is somewhat vague and undefined, generally, however, it is used to denote an offense of a high grade, punishable either capitally or by a term of imprisonment. In Massachusetts, by statute, any crime punishable by death or imprisonment in the state prison, and no other, is a *felony,* so in New York The tendency now is to obliterate the distinction between *felonies* and *misdemeanors,* and this has been done partially in England, and completely in some of the States of the Union The distinction is purely arbitrary, and its entire abolition is only a question of time

☞ There is no lawyer who would undertake to tell what a *felony* is, otherwise than by enumerating the various kinds of offenses which are so called Originally, the word *felony* had a meaning it denoted all offenses the penalty of which included forfeiture of goods, but subsequent acts of Parliament have declared various offenses to be *felonies,* without enjoining that penalty, and have taken away the penalty from others, which continue, nevertheless, to be called *felonies,* insomuch that the acts so called have now no property whatever in common, save that of being unlawful and punishable *J. S. Mill*

(*a*) Formed or organized ferments (*b*) Unorganized or structureless ferments The latter are also called *soluble* or *chemical ferments* and *enzymes* Ferments of the first class are as a rule simple microscopic vegetable organisms, and the fermentations which they engender are due to their growth and development, as, the *acetic ferment*, the *butyric ferment*, etc. See **Fermentation** Ferments of the second class on the other hand, are chemical substances, as a rule soluble in glycerin and precipitated by alcohol In action they are catalytic and, mainly, hydrolytic. Good examples are pepsin of the gastric juice, ptyalin of the saliva and diastase of malt.

— Alcoholic fermentation, the fermentation which saccharine bodies undergo when brought in contact with the yeast plant or Torula. The sugar is converted, either directly or indirectly, into alcohol and carbonic acid, the rate of action being dependent on the rapidity with which the Torulæ develop. **— Ammoniacal fermentation,** the conversion of the urea of the urine into ammonium carbonate, through the growth of the special urea ferment.

$CON_2H_4 + 2H_2O = (NH_4)_2CO_3$

Whenever urine is exposed to the air in open vessels for several days it undergoes this alkaline fermentation. **— Butyric fermentation,** the decomposition of various forms of organic matter, through the agency of a peculiar worm-shaped vibrio, with formation of more or less butyric acid It is one of the many forms of fermentation that collectively constitute putrefaction. See *Lactic fermentation.* **— Fermentation by an unorganized ferment *or* enzyme.** Fermentations of this class are purely chemical reactions, in which the ferment acts as a simple catalytic agent Of this nature are the decomposition or inversion of cane sugar into levulose and dextrose by boiling with dilute acids, the conversion of starch into dextrin and sugar by similar treatment, the conversion of starch into like products by the action of diastase of malt or ptyalin of saliva, the conversion of albuminous food into peptones and other like products by the action of pepsin-hydrochloric acid of the gastric juice or by the ferment of the pancreatic juice **— Fermentation theory of disease** (*Biol. & Med.*), the theory that most, if not all, infectious or zymotic diseases are caused by the introduction into the organism of the living germs of ferments, or ferments already developed (organized ferments), by which processes of fermentation are set up injurious to health See GERM THEORY. **- Glycerin fermentation,** the fermentation which occurs on mixing a dilute solution of glycerin with a peculiar species of schizomycetes and some carbonate of lime, and other matter favorable to the growth of the plant, the glycerin being changed into butyric acid, caproic acid, butyl, and ethyl alcohol With another form of bacterium (*Bacillus subtilis*) ethyl alcohol and butyric acid are mainly formed **Lactic fermentation,** the transformation of milk sugar or other saccharine body into lactic acid, as in the souring of milk, through the agency of a special bacterium (*Bacterium lactis* of Lister) In this change the milk sugar, before assuming the form of lactic acid, presumably passes through the stage of glucose.

$C_{12}H_{22}O_{11}.H_2O = 4C_3H_6O_3$
Hydrated milk sugar. Lactic acid.

In the lactic fermentation of dextrose or glucose, the lactic acid which is formed is very prone to undergo butyric fermentation after the manner indicated in the following equation. $2C_3H_6O_3$ (lactic acid) $= C_4H_8O_2$ (butyric acid) $+ 2CO_2$ (carbonic acid) $+ 2H_2$ (hydrogen gas). **— Putrefactive fermentation.** See PUTREFACTION

2 (*Geom.*) A point so related to a conic section and a certain straight line called the *directrix* that the ratio of the distance between any point of the curve and the focus to the distance of the same point from the directrix is constant

A B Foci of an Ellipse.

☞ Thus, in the ellipse FGHKLM, A is the focus and CD the directrix, when the ratios FA : FE, GA : GD, MA : MC, etc., are all equal. So in the hyperbola, A is the focus and CD the directrix when the ratio HA : HK is constant for all points of the curve, and in the parabola, A is the focus and CD the directrix when the ratio BA : BC is constant. In the ellipse this ratio is less than unity, in the parabola equal to unity, and in the hyperbola greater than unity. The ellipse and hyperbola have each two foci, and two corresponding directrixes, and the parabola has one focus and one directrix.

A B Foci of Hyperbola

A Focus of Parabola

In the ellipse the *sum* of the two lines from any point of the curve to the two foci is constant: that is: AG + GB = AH + HB; and in the hyperbola the *difference* of the corresponding lines is constant. The diameter which passes through the foci of the ellipse is the *major axis*. The diameter which being produced passes through the foci of the hyperbola is the *transverse axis*. The middle point of the major or the transverse axis is the *center* of the curve. Certain other curves, as the lemniscate and the Cartesian ovals, have points called *foci*, possessing properties similar to those of the foci of conic sections.

In an ellipse, rays of light coming from one focus, and reflected from the curve, proceed in lines directed *toward* the other, in an hyperbola, in lines directed *from* the other, in a parabola, rays from the focus, after reflection at the curve, proceed in lines parallel to the axis. Thus rays from A in the ellipse are reflected to B; rays from A in the hyperbola are reflected toward L and M away from B.

1 What is fed upon; that which goes to support life by being received within, and assimilated by, the organism of an animal or a plant, nutriment, aliment; especially, what is eaten by animals for nourishment.

The proteids, on the other hand, are known as *plastic foods* or *tissue formers,* since no tissue can be formed without them These latter terms, however, are misleading, since proteid foods may also give rise to heat both directly and indirectly, and the fats and carbohydrates are useful in other ways than in producing heat

The civil magistrate also grants a *pardon*, and not *forgiveness*. The two words are, therefore, very clearly distinguished from each other in most cases which relate to the common concerns of life.

See *Trigonometrical function* (below). Other transcendental functions are the *exponential functions*, the *elliptic functions*, the *gamma functions*, the *theta functions*, etc. — **One-valued function**, a quantity that has one, and only one, value for each value of the variable. — **Transcendental function**, a quantity whose connection with the variable cannot be expressed by algebraic operations, thus, y in the equation $y = 10^x$ is a transcendental function of x. See *Algebraic function* (above). — **Trigonometrical function**, a quantity whose relation to the variable is the same as that of a certain straight line drawn in a circle whose radius is unity, to the length of a corresponding arc of the circle. Let AB be an arc in a circle, whose radius OA is unity, let AC be a quadrant, and let OC, DB, and AF be drawn perpendicular to OA, and EB and CG parallel to OA, and let OB be produced to G and F. Then BD is the sine of the arc AB; OD or EB is the cosine, AF is the tangent, CG is the cotangent, OF is the secant, OG is the cosecant, AD is the versed sine, and CE is the coversed sine of the arc AB. If the length of AB be represented by x (OA being unity), then the lengths of these lines (OA being unity) are the trigonometrical functions of x, and are written $\sin x$, $\cos x$, $\tan x$ (or $\tang x$), $\cot x$, $\sec x$, $\operatorname{cosec} x$, $\operatorname{versin} x$, $\operatorname{coversin} x$. These quantities are also considered as functions of the angle BOA.

1. An aeriform fluid, — a term used at first by chemists as synonymous with *air*, but since restricted to fluids supposed to be permanently elastic, as oxygen, hydrogen, etc., in distinction from vapors, as steam, which become liquid on a reduction of temperature In present usage, since all of the supposed permanent gases have been liquefied by cold and pressure, the term has resumed nearly its original signification, and is applied to any substance in the elastic or aeriform state.

2. (*Popular Usage*) (*a*) A complex mixture of gases, of which the most important constituents are marsh gas, olefiant gas, and hydrogen, artificially produced by the destructive distillation of gas coal, or sometimes of peat, wood, oil, resin, etc. It gives a brilliant light when burned, and is the common gas used for illuminating purposes (*b*) Laughing gas. It is chiefly derived from the Coal Measures. — **Oleäsat gas.** (*Chem.*) See ETHYLENE — **Water gas** (*Chem.*), a kind of gas made by forcing steam over glowing coals, whereby there results a mixture of hydrogen and carbon monoxide. GILD, *v. t.*] **1.** (*Chem.*) A metallic element, constituting the most precious metal used as a common commercial medium of exchange. It has a characteristic yellow color, is one of the heaviest substances known (specific gravity 19.32), is soft, and very malleable and ductile. It is quite unalterable by heat, moisture, and most corrosive agents, and therefore well suited for its use in coin and jewelry. Symbol Au (*Aurum*). Atomic weight 196.7.

☞ Native gold contains usually eight to ten per cent of silver, but often much more As the amount of silver increases, the color becomes whiter and the specific gravity lower. Gold is very widely disseminated, as in the sands of many rivers, but in very small quantity. It usually occurs in quartz veins (gold quartz), in slate and metamorphic rocks, or in sand and alluvial soil, resulting from the disintegration of such rocks. It also occurs associated with other metallic substances, as in auriferous pyrites, and is combined with tellurium in the minerals *petzite*, *calaverite*, *sylvanite*, etc. Pure gold is too soft for ordinary use, and is hardened by alloying with silver and copper, the latter giving a characteristic reddish tinge. [See CARAT.] Gold also finds use in gold foil, in the pigment *purple of Cassius*, and in the chloride, which is used as a toning agent in photography.
